Juan Camilo Gutiérrez

Senior / Lead Backend Engineer — Go, Distributed Systems, AI Developer Tooling

Buenos Aires, Argentina | +54 9 11 6793-1491 | juan.camilo.gutierrez.alkapa@gmail.com | linkedin.com/in/juancamilogutierrezgutierrez | github.com/alkapa

Summary

Backend engineer with 10+ years building scalable, cloud-native distributed systems in Go at high-scale Argentine fintechs (Ualá, MODO, Mercado Libre). Specialized in event-driven and serverless architecture, observability, and internal developer tooling with measurable impact: transaction queries from 3s to 300ms, +45% development speed, MTTA from 10 minutes to 2. Ships to production frequently, leads technically, and builds AI-assisted tooling that raises team throughput.

Experience

Senior Software Engineer | MODO *Jan 2026 – Jun 2026*

- Designed and shipped a cross-squad engineering quality dashboard tracking the four DORA metrics (deploy frequency, lead time, change failure rate, MTTR) alongside test coverage, vulnerabilities, and security posture.
- Authored the technical proposal to standardize AI agent scaffolding across the organization, with a documented design and a reference implementation validated on a pilot repository.

Senior to Lead Software Engineer | Ualá *Apr 2022 – Jan 2026*

- Built a cursor-paginated transaction query service (GraphQL-style) with advanced filtering: cut query time from 3s to 300ms and became the org-wide standard; a DynamoDB access-pattern redesign cut app load times by 75%.
- Designed lambda-go, an internal Go framework for serverless services that standardized scaffolding: +45% development speed, -60% code review load.
- Ran the Ualá Bis payments platform (~1,200 active merchants, ~20M transactions/month, 18 microservices, 1,000+ AWS Lambda functions in Go): cut Lambda execution times ~45% and held latencies under 100ms.
- Created internal observability and error-handling libraries (utel, ulog, error_manager) that cut MTTA from 10 minutes to 2, plus ualess, an AI-assisted scaffolding tool (+20% runtime performance).
- Led technical delivery of batch settlement and the launch of the Link de Pago and PSE payment products in Colombia; mentored 3–4 engineers and drove an AI-first engineering culture.

Software Development Analyst, Ssr | Mercado Libre *Feb 2021 – Apr 2022*

- On the Route ETA team, diagnosed a memory leak and latency regression in a high-concurrency routing service caused by an uncancelled context; migrated it to an async, event-driven HTTP client with cancellable context, cutting execution times ~20% and stabilizing memory usage.

Software Engineer | Frávega *Mar 2020 – Feb 2021*

- Migrated the logistics system from a centralized COBOL process to an event-orchestrated architecture (central orchestrator plus Go microservices over Kafka); introduced gRPC for service-to-service communication on AWS with Kubernetes and MongoDB.

Backend Developer | EcomExperts *Mar 2019 – Mar 2020*

- Built multi-cloud (AWS, GCP, Azure) e-commerce integration backends across Shopify, Magento, VTEX, Linio, and Mercado Libre; implemented the Mercado Libre catalog as an early adopter of its first API version.

BI Analyst / Developer | Megaly Tech and prior roles *2014 – 2019*

Business data analysis, modeling, and visualization with Python, JavaScript, SQL, and QlikView.

Projects

Gitar — Git Agentic Review. Local, pre-commit AI code review with a GitHub pull-request-style experience and a pair-programming flow; validated through live demos.

Mado — Agent Orchestration Protocol. Verifiable, deterministic coordination of AI agents built on four axioms (independent R&D).

Skills

Languages: Go (primary), Node.js, TypeScript, Rust, Python, SQL

Architecture: Microservices, distributed systems, serverless, event-driven (EDA), hexagonal, Clean Architecture, DDD

Platform & Data: AWS (Lambda, DynamoDB, SQS, SNS, EventBridge), GCP, Azure, Kubernetes, Docker, Terraform, GitHub Actions; PostgreSQL, MySQL, MongoDB, Redis; Kafka, RabbitMQ; gRPC, GraphQL, REST

Reliability & AI: OpenTelemetry, New Relic, Grafana, CloudWatch, testing, benchmarking, profiling; LLM-based agents and orchestration, AI-assisted scaffolding, AI code review, MCP/ACP

Education

Universidad Nacional de San Martín (UNSAM) — Software Programming *2017 – 2020*

Languages: Spanish (native) | English (professional working proficiency)
